Taking trunk control to a new level with Targeted Training

Supporting Children

## Introducing the EVOLUTIONARY NEW Squiggles TT

Taking trunk control to a new level is what Leckey's new early intervention standing frame is all about. It has been specifically designed to enable therapists and parents to engage in Targeted Training to help children develop trunk control in a fun and interactive way.

This evidence-based therapy is carried out with the child (aged 1-5 years old) in an upright position, training just one segment of their trunk at a time<sup>1</sup>. This allows them to gain sequential control from the top down, with the equipment supporting the uncontrolled segments.

Targeted Training can reduce the amount of equipment and intervention children may need in later life, giving them the chance to be more **independent** and **gain vital**, **functional skills**<sup>2</sup>.

#### Accomplish more with the Squiggles TT

#### So, what do I need to know to start?

Using Squiggles TT, you can enhance your child's current standing programme by incorporating Targeted Training into the routine, or use it as a stand alone therapy. The recommended time to gain maximum results is typically over a 9-12-month period.

An assessment of trunk control is first needed to determine where to begin with Targeted Training. This is best achieved using the validated Segmental Assessment of Trunk Control (SATCo) outcome measure which can be carried out with the Leckey Therapy Bench and Activity Cradle.

Visit our therapy bench product page for more information and guidance on SATCo www.leckey.com/products/therapy-bench

**Squiggles+ users! Did you know?** You can quickly & easily change to Targeted Training with our conversion kit.

Targeted Training can provide life changing skills from an early age, impacting a child's future and giving them the chance to live life to their fullest.

[online] Available at: https://www.themovement-centre.co.uk/targeted-training/benefits/ We're here to make your journey into Targeted Training much easier, allowing you to change the future for children everywhere with the Squiggles TT.

55 Targeted Training is a ground-breaking therapy approach that can offer significant benefits to a child, helping them increase functional abilities by improving trunk control.

From my experience of working with the Leckey team on Squiggles TT, I would happily recommend its use for Targeted Training to help a wide range of children achieve their maximum potential.

Penny Butler, Physiotherapy Consultant

#### **Technical Information**

Suitability for Targeted Training should be discussed with your therapist.

### **Technical Table Max User Weight** 22Kg/48.4lbs Age **User Height** Chest support height (distance from footplate to armpit) Chest/Hip width Hip support height (distance from footplate to mid-buttock) **Distance between midline of knees Footplate Pivot chassis angle range Tray height Pivot chassis footprint (min dimensions for storage)** Height 300mm/11.8in Standard support frame (min dimensions for storage)
