Freedom

Joystick and Freedom

Joystick
Joystick is a device with a latest generation electronic control system, designed with different types of controls to allow people with severe disabilities such as quadriplegia or without the upper limbs, to drive the vehicle with the use of the hands or foot. The Joystick is available with different types of handle.

Freedom
Freedom is a device that combines a mechatronic braking system with an electronic accelerator system. It can be used by people with serious illnesses such as quadriplegia to drive the vehicle in the brake and accelerator controls.

The combination of the Joystick control with Freedom allows the complete management of the vehicle with steering and brake/accelerator.
The use of the devices does not influence the choice of the vehicle, which must be suitable in any case.
The installation does not affect the characteristics of the vehicle, which can still be used by people with disabilities.
